Girish,

We have a couple of questions that we were hoping Cummins could answer for us.

For AECD #10 **CBI/ Ex. 4**, we need to discuss how Cummins will account for the increased NOx emissions. Per 86.1840-01 (special test procedures), Cummins needs to inform EPA how they will account for the additional NOx emissions resulting from **CBI/ Ex. 4** regeneration. We would suggest an approach similar to that found under 86.004-28(i) which uses adjustment factors. We would be willing to discuss any type of adjustment factor that Cummins would be consider appropriate for the Dodge Ram application.

For AECD #11 **CBI/ Ex. 4**, we need to understand more about how this AECD operates. For example, at low temperatures, you will modulate

CBI/ Ex. 4

CBI/ Ex. 4 Perhaps we could schedule a phone call to discuss this further.

Regards,
Linc
